Context

- Description of a hydrogen tank

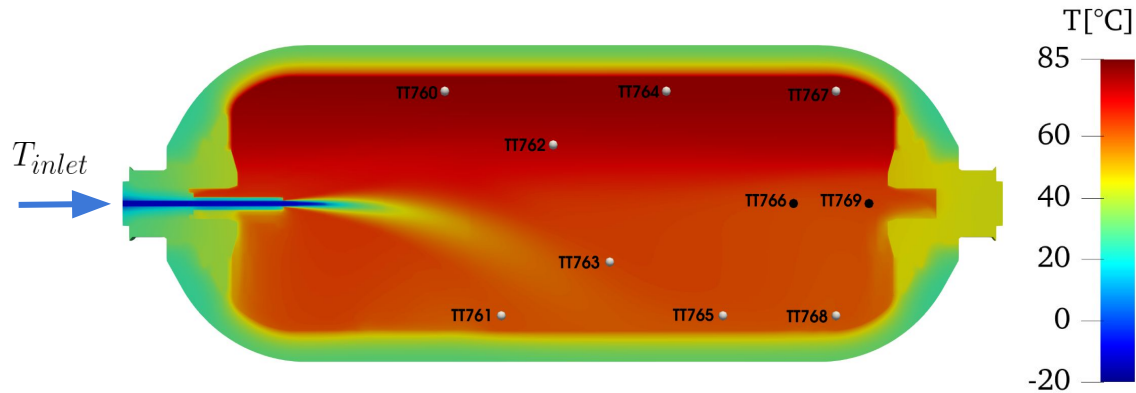

*for the type IV 37 L tank provided by Lincoln Hexagon

Context

- Tank filling mechanism

Injecting hydrogen in a closed volume: **Pressure** **Temperature**

Recommendation from SAE J2601

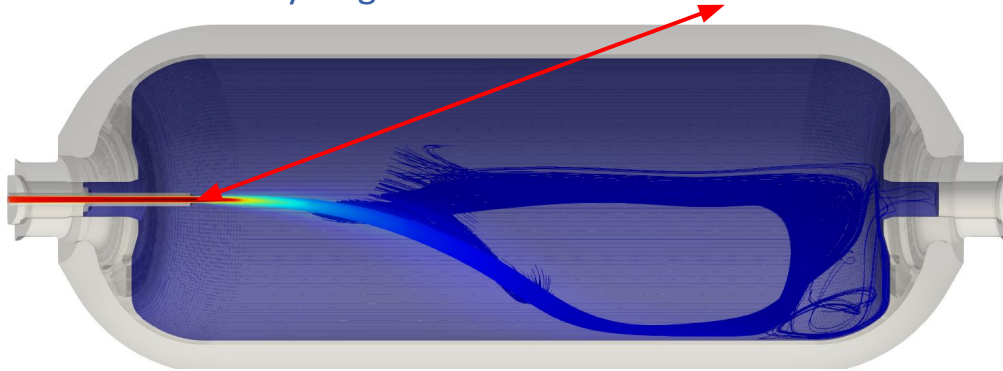

Parameters	Limits
Gas temperatures	[-40°C, 85°C]
Gas pressures	[5 bar, 875 bar]
Mass flowrate	60 g/s

Context

- Previous results on thermal gradients

- ❖ Terada et al. (2008)

- The criterion **5 m/s** at the **inlet velocity** is suggested to detect thermal gradient onset for hydrogen tank

Illustrative image **not issue from Terada study.**

“Hydrogen gas in the tank is agitated and the internal temperature of the tank is uniformed when the gas jet velocity is high. If the gas jet velocity decreases to 5 m/s then the fluid behavior in the tank changes and convection dominates over agitation, causing distribution of temperatures and the temperature in the upper area of the tank rises.”

Terada, Toshihiro, Hiroshi Yoshimura, Yohsuke Tamura, Hiroyuki Mitsuishi, et Shogo Watanabe. « Thermal Behavior in Hydrogen Storage Tank for Fcv on Fast Filling (2nd Report) », 2008-01-0463, 2008. <https://doi.org/10.4271/2008-01-0463>.

Context

- Observation of vertical thermal gradients

Type IV 37 L tank provided by Lincoln Hexagon with a $L/D = 2.4$

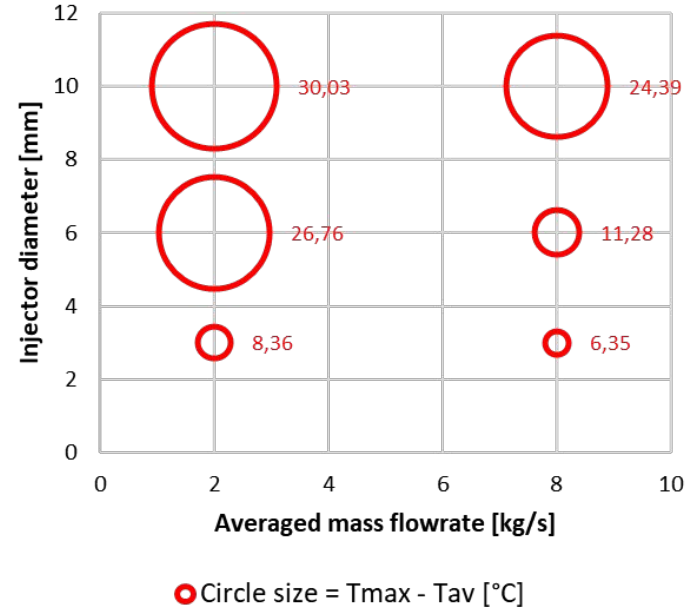

Diameter: 3 mm

6 mm

10 mm

Averaged mass flowrate: 8 g/s (filling time \approx 160 s)
2 g/s (filling time \approx 600 s)

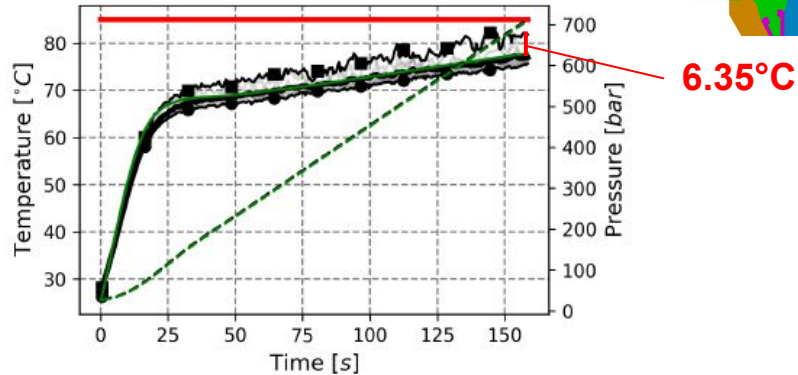

HyTransfer conclusion: The **smaller** the inlet gas velocity; the **larger** the vertical thermal gradients. The criterion 5 m/s at the inlet velocity works for the 37 L tank.

Context

- Two extreme scenarios with experimental results

D3Q8: Homogeneous case

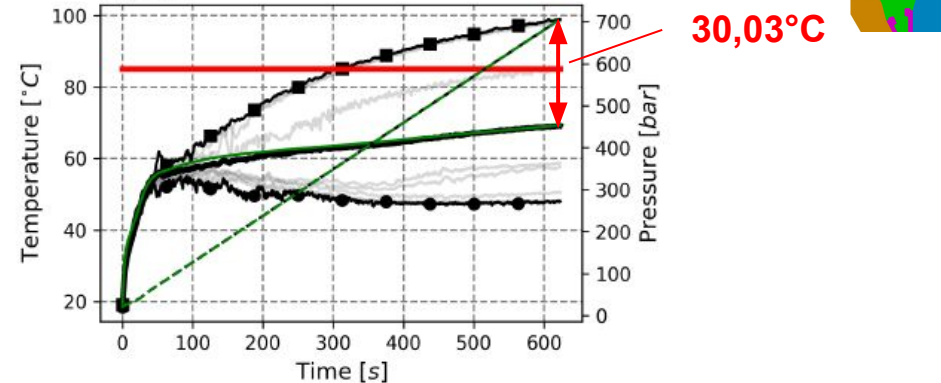

- Tank capacity: 37 L
- Injection diameter: 3 mm
- Average filling rate: 8 g/s
- injection pipe

6.35°C

D10Q2: Heterogeneous case

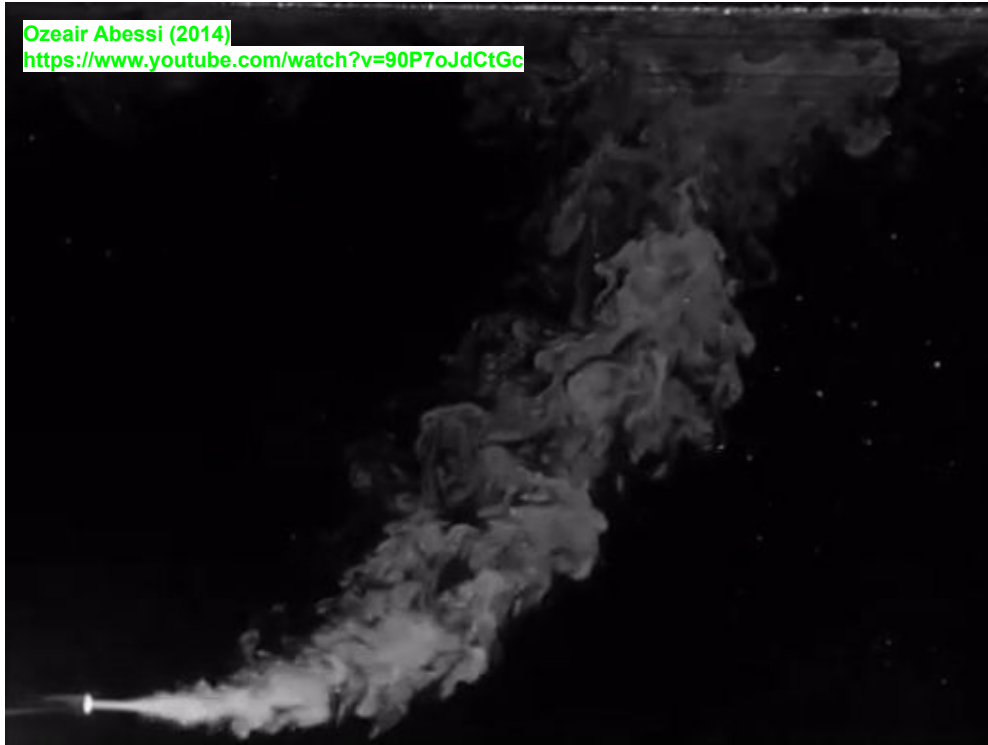

- Tank capacity: 37 L
- Injection diameter: 10 mm
- Average filling rate: 2 g/s
- No injection pipe

30,03°C

Buoyant Jet model

- Modeling

Hypotheses :

- Steady-state
- Uniform pressure
- Viscosity term neglected
- Boussinesq approximation
- Velocity and density profiles imposed
- Self-similarity
- Entrainment rate modeled

Physical quantities

- Mass flux
- Momentum flux
- Buoyancy flux
- Jet deviation angle
- Jet trajectory coordinate

Initial conditions

$$\begin{aligned}
 Q(L_{ZFE}) &= 1.72\pi r_0^2 u_0 \\
 M(L_{ZFE}) &= \pi u_0^2 r_0^2 \\
 J(L_{ZFE}) &= \frac{\lambda^2}{\lambda^2 + 1} Q(L_{ZFE}) \frac{\rho_{grad}(0) - \rho_0}{\rho_{ref}} g \\
 \theta(L_{ZFE}) &= 0 \\
 x(L_{ZFE}) &= L_{ZFE} = 9,79 r_0 \\
 y(L_{ZFE}) &= 0
 \end{aligned}$$

Equation system

$$\begin{aligned}
 \frac{\partial Q}{\partial s} &= (8\pi M)^{1/2} \alpha && \text{Entrainment rate modeled} \\
 \frac{\partial M}{\partial s} &= (\lambda^2 + 1) \frac{JQ}{2M} \sin(\theta) && \text{Linear stratified environment} \\
 \frac{\partial J}{\partial s} &= Q \frac{g}{\rho_{ref}} \frac{\partial \rho_{grad}(y)}{\partial y} \sin(\theta) \\
 \frac{\partial \theta}{\partial s} &= (\lambda^2 + 1) \frac{JQ}{2M^2} \cos(\theta) \\
 \frac{\partial x}{\partial s} &= \cos(\theta) \\
 \frac{\partial y}{\partial s} &= \sin(\theta)
 \end{aligned}$$

Buoyant Jet model

- Froude number

Equation system

$$\begin{aligned} \frac{\partial Q}{\partial s} &= (8\pi M)^{1/2} \alpha \\ \frac{\partial M}{\partial s} &= (\lambda^2 + 1) \frac{JQ}{2M} \sin(\theta) \\ \frac{\partial J}{\partial s} &= Q \frac{g}{\rho_{ref}} \frac{\partial \rho_{grad}(y)}{\partial y} \sin(\theta) \\ \frac{\partial \theta}{\partial s} &= (\lambda^2 + 1) \frac{JQ}{2M^2} \cos(\theta) \\ \frac{\partial x}{\partial s} &= \cos(\theta) \\ \frac{\partial y}{\partial s} &= \sin(\theta) \end{aligned}$$

Jet trajectory

$$y = f(x)$$

Thermal gradient onset =
jet impacting the lower part of the tank

$$-R_{int} = f(L_{tank} - L_{pipe})$$

Buoyant Jet model

- Froude number

Equation system

$$\left\{ \begin{aligned} \frac{\partial Q}{\partial s} &= (8\pi M)^{1/2} \alpha \\ \frac{\partial M}{\partial s} &= (\lambda^2 + 1) \frac{JQ}{2M} \sin(\theta) \\ \frac{\partial J}{\partial s} &= Q \frac{g}{\rho_{ref}} \frac{\partial \rho_{grad}(y)}{\partial y} \sin(\theta) \\ \frac{\partial \theta}{\partial s} &= (\lambda^2 + 1) \frac{JQ}{2M^2} \cos(\theta) \\ \frac{\partial x}{\partial s} &= \cos(\theta) \\ \frac{\partial y}{\partial s} &= \sin(\theta) \end{aligned} \right.$$

Simplified equation system

$$\left\{ \begin{aligned} \frac{dQ}{ds} &= (8\pi M)^{1/2} \alpha \\ \frac{dM}{ds} &= 0 \\ \frac{dJ}{ds} &= 0 \\ \frac{d\theta}{ds} &= (\lambda^2 + 1) \frac{JQ}{2M^2} \\ x &= s \\ y &= \theta \end{aligned} \right.$$

Jet trajectory

$$y = (\lambda^2 + 1) \frac{J(L_{ZFE})}{2M(L_{ZFE})^2} (x - L_{ZFE}) [Q(L_{ZFE}) + 4\pi M^{1/2} \alpha (x - L_{ZFE})]$$

Thermal gradient onset =
jet impacting the lower part of the tank

$$\left\{ \begin{aligned} R_{tank} &= (\lambda^2 + 1) \frac{\rho_{ref} - \rho_0}{\rho_{ref}} \frac{g \tilde{L}^2}{u_0^2} (0.37 + 0.23 \frac{\tilde{L}}{r_0} \alpha) \\ \tilde{L} &= L_{tank} - L_{inj} - L_{ZFE} \end{aligned} \right.$$

Froude number construction

$$Fr = \frac{u_0}{\sqrt{\frac{\rho_{ref} - \rho_0}{\rho_{ref}} g R_{tank} \tilde{L}^2 (0.74 + 0.0223 \frac{\tilde{L}}{r_0})}}$$

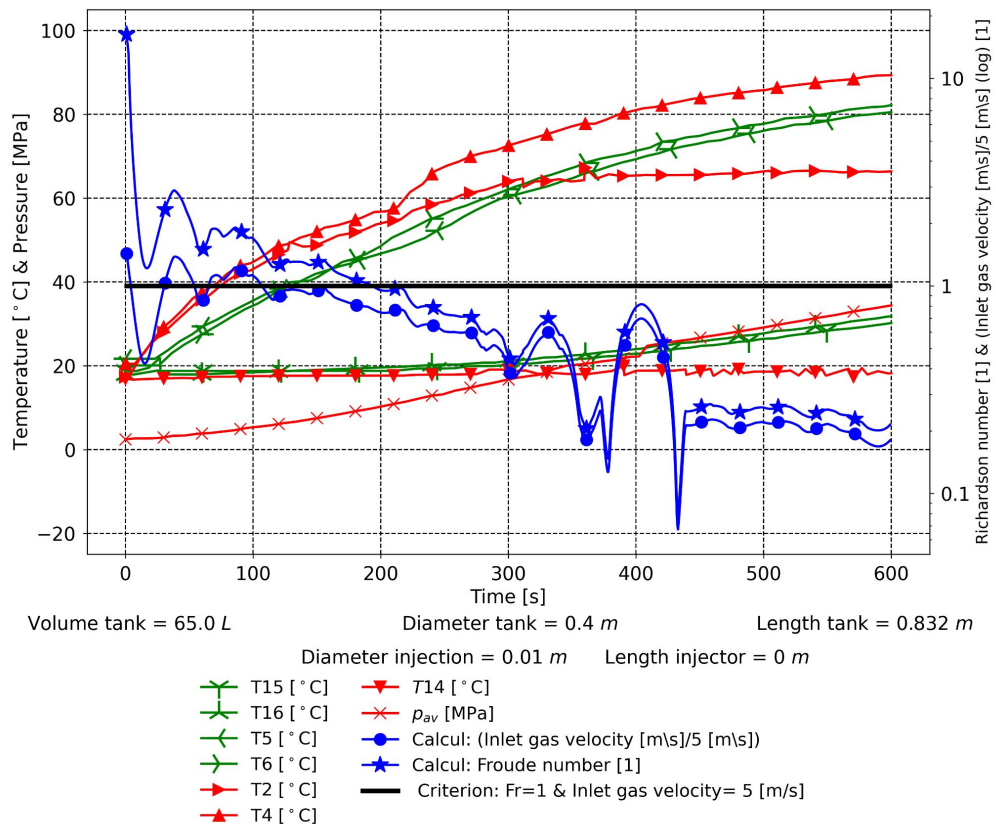

Buoyant Jet model

- Conclusions

- ✓ For some filling conditions of horizontal tanks, experimental measurements showed **thermal stratification can reach 30°C between the maximal gas temperature and the average gas temperature**
- ✓ Thermodynamic based model (**0D model**) can only **predict the volume averaged gas temperature in the tank**
- ✓ In the literature, only **Terada** gave a **minimal limit of 5 m/s** for the **gas velocity at the injection, to avoid thermal stratification in horizontal hydrogen tank with axial injection** based on experimental study using a type IV 65 liter tank
- ✓ Using a phenomenological approach, a buoyant jet model is used to suggest a **Froude number limit of 1** considering the filling conditions and the tank geometry to predict thermal stratification
- ✓ This **Froude number minimal limit of 1** is **consistent with the Terada criteria for small aspect ratio tanks. It gives better predictions for longer aspect ratio tanks.**
